ABSTRACT:

PROBLEM TO BE SOLVED: To perform cashless services at respective places in a hotel, and improve the serviceability by a method wherein on a non-contact IC card carried by lodgers, their name, room number, purchase prices and the total amount are recorded in order, and respective data are displayed on a display part.

SOLUTION: This non-contact IC card 10 which is carried by a lodger has a display part 11, and in which a data transmitting-receiving part 13 comprising an IC chip 12 and a wire-wound coil which is connected with the IC chip 12, is embedded, and a thin battery 14 is included when necessary. Also, this non- contact IC card 10 can communicate with the operation panel of an elevator, a door gate device of a guest room or the like under a non-contact state, and also, is equipped with a memory which can store data such as the name of a lodger, the number of a guest room, usage restricted areas, and a used amount of money for dining and drinking or the like. In addition, this non-contact IC card 10 is constituted in such a manner that required data can be written by a reading-writing device or the like and be displayed. A recording to the display part 11 is performed by reading and writing the content of the memory by a terminal reading-writing device at respective places in a hotel.
